

IT Designs and Specifications

Apex has the best engineers using the best technology to build the most effective and cost-efficient network solutions for the best reason — you.

Apex's engineers rank among the best in the country for thoughtful, reliable, cost-effective network designs and specifications.

Cisco, Microsoft, Aruba, Juniper and other vendor technologies are integrated into designs that provide varying degrees of price/performance tradeoffs. Apex helps clients make informed decisions about IT expenditures based on these performance and price tradeoffs. Apex uses Visio, CAD and other industry-standard tools to develop and render network designs.

Apex's designs are comprehensive and provide detailed specifications that can be procured and implemented by the client's internal or external Apex staff. Many clients, even with their own installation teams, engage Apex in the critical engineering phase of IT projects to bring real-world experience and ensure pragmatic infrastructure designs.

As with any Apex product or service, IT designs and specifications can be discounted as part of a customized Personal CIO™ Program. Additionally, if a client procures the recommended hardware, software and services through Apex, designs and specifications are often included free of charge.
